

Notes from project mission.

### 1.2.1

I think some clarification can be done here. The processing server and system for delivering satellite data from the copernicus project is mostly what this project will be working towards.

Based on our talk yesterday I think it's a good idea to make sure that it's clear that you'll be focused on primarily satellite data and other data sources are of secondary importance and framed more as an area in which this product could develop in the future.

3.2 Very ambitious goal! Good stuff.

### 4.1

I don't think this part is accurate or it's missing a lot of information.

Within the scope of this project there are two iterations of satellite processing to keep in mind. The initial processing which turns raw images into planthealth data and nitrogen recommendations based on a specified area and the processing which is done on top of that.

Here's a simple diagram to illustrate that relationship.
